DETAILED ACTION

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 15-34 are rejected under 35 U.S.C. 102(b) as being anticipated by Albrecht (3,950,113).

In figures 1-3, Albrecht teaches a turbine blade, comprising: a blade leaf 11 arranged along a blade axis having a blade tip (not numbered), a root opposite the tip 12, a suction side and a pressure side (not numbered); a platform region 15 arranged at the root of the blade leaf; and a platform arranged at the platform region having a width and extending transversely with respect to the blade axis and partially formed by a first sheet metal component 24 secured to a first abutment 15 arranged on the blade leaf such that the first sheet metal component 24 forms a seal when installed between the first abutment 15 and a second abutment arranged on an adjacent turbine blade. (See column 2, lines 30-68), column 4, lines 1-7).

Prior Art

Prior art made of record but not relied upon is considered pertinent to Applicant's disclosure and consist of three patents.

Penny (3,389,889) is cited to show a turbine blade, comprising: a blade leaf arranged along a blade axis having a blade tip, a root opposite the tip, a suction side and a pressure side; a platform region arranged at the root of the blade leaf; and a platform arranged at the platform region having a width and extending transversely with respect to the blade axis and partially formed by a first sheet metal component secured to a first abutment arranged on the blade leaf but fails to teach the first sheet metal component forms a seal when installed between the first abutment and a second abutment arranged on an adjacent turbine blade.

Hallinger (4,457,668) is cited to show a turbine blade, comprising: a blade leaf arranged along a blade axis having a blade tip, a root opposite the tip, a suction side and a pressure side; a platform region arranged at the root of the blade leaf; and a platform arranged at the platform region having a width and extending transversely with respect to the blade axis but fails to teach a first sheet metal component secured to a first abutment arranged on the blade leaf such that the first sheet metal component forms a seal when installed between the first abutment and a second abutment arranged on an adjacent turbine blade.

Simonetti et al. (6,398,499) is cited to show a turbine blade, comprising: a blade leaf arranged along a blade axis having a blade tip, a root opposite the tip, a suction side and a pressure side; a platform region arranged at the root of the blade leaf; and a platform arranged at the platform region having a width and extending transversely with respect to the blade axis but fails to teach a first sheet metal component secured to a first abutment arranged on the blade leaf such that the first sheet metal component
